

HACKDATAV2 · SUBMISSION

Synthetic data platform

Realistic, privacy-safe tabular, relational and document data — generated on demand.

Tabular Data

Relational Structures

Document Generator

THE PROBLEM

Real data is scarce, sensitive, and slow to get

Privacy & compliance

Teams can't freely share production data across environments, partners, or the cloud.

Limited, messy datasets

Real datasets are small, skewed, or missing the edge cases engineers need to test against.

Slow procurement cycles

Getting a sanctioned data extract for a demo or a test suite can take weeks of sign-off.

OUR APPROACH

Schema-aware, not random

Ingest schema

Infer tables, columns, types and keys from a sample or a schema file.

Model relationships

Learn distributions, correlations and foreign-key cardinalities across tables.

Generate with AI

An AI layer fills in realistic names, text, and edge cases the schema alone can't describe.

Validate & export

Check referential integrity and statistical fidelity, then export to your format of choice.

From schema to shippable data

FEATURE

Tabular data generation

- Statistically faithful distributions for numeric and categorical columns
- Configurable row count, random seed, and null / outlier rates
- Column-level privacy controls: masking, hashing, and differential noise

Sample synthetic output

ID	Name	Email	Signu p	Bala nce
10231	Maria Chen	m.chen@example.com	2025-02-11	\$482.10
10232	Ahmed Raza	a.raza@example.com	2025-03-04	\$129.55
10233	Sofia Ivanova	s.ivanova@example.com	2025-01-27	\$918.42

FEATURE

Relational data structures

- Referential integrity maintained automatically across every generated table
- Cardinalities are configurable — 1:1, 1:N, and N:N
- Cross-table consistency: order totals reconcile with their line items

Invoices

- Realistic line items, tax rules, and totals that reconcile automatically
- Templated layouts per region — date formats, currency, tax labels
- Bulk generation for testing invoicing and reconciliation pipelines

INVOICE

#INV-10432

BILLED TO

Northwind Supplies Ltd.

FROM

Synth Data Co.

Item	Qty	Price	Amount
API access — Pro tier	1	\$1,100.00	\$1,100.00
Onboarding support	1	\$140.00	\$140.00

Total: \$1,240.00

Bank statements & queries

- Transaction histories with realistic merchants, amounts, and running balances
- Structured exports (JSON / CSV) or formatted statement documents
- Query-style generation, e.g. “last 90 days, balance over \$500”

Sample statement excerpt

Date	Description	Debit	Credit	Balance
08-14	Greenleaf Market	\$42.10		\$1,204.30
08-15	Payroll deposit		\$2,150.00	\$3,354.30
08-17	Riverside Utilities	\$96.40		\$3,257.90

Where AI does the work

Schema understanding

Infers column types, formats and relationships directly from a small sample, no manual mapping.

Realistic content synthesis

Names, addresses and free-text fields read naturally instead of looking machine-generated.

Edge-case injection

Proposes nulls, outliers, and rare patterns so test suites cover more than the happy path.

EXPERIENCE

One workspace, three data types

WHY IT WINS

Built against the judging criteria

Criterion	How we deliver
System design	Modular engine — tabular, relational and document generators share one schema-aware pipeline
Features	Tabular, relational, and document generation (invoices, bank statements) in a single platform
UI	One workspace to configure, preview, and export — no code required
AI	AI infers schemas, synthesizes realistic content, and injects meaningful edge cases
Problem approach	Solves data scarcity and privacy constraints without ever touching real records
